7. Integrating Zoho Creator with Zoho CRM via Connections and APIs

Aim

To study how a Zoho Creator form can be integrated with Zoho CRM through an authenticated connection and a workflow action, so that a successful submission creates a record in the CRM.

Theory

A connection in Zoho Creator stores the authorised access (OAuth) to another service such as Zoho CRM. A form workflow can then use that connection to create or update CRM records through the integration action or an API call written in Deluge, so data entered once is available in both systems.

Procedure

These steps describe how a Zoho Creator form is integrated with Zoho CRM. The Claim_Requests form is used as the example.

1. Decide which form will send data. In this application the Claim_Requests form is the natural candidate and would map to a CRM lead.
2. Go to Settings, Connections, add a Zoho CRM connection (for example zoho_crm_conn) with the scope ZohoCRM.modules.ALL, authorise it with OAuth and check that its status shows Connected.
3. Open the Workflow tab, select the form and create a workflow on Created > Successful form submission.
4. Add a Deluge script that maps the form fields to CRM fields, as in the illustrative example below, and enable the workflow.

```
leadMap = Map();
leadMap.put("Last_Name", input.Claimant_Name.last_name);
leadMap.put("Email", input.Claimant_Email);
leadMap.put("Description", input.Proof_Ownership_Details);
resp = zoho.crm.createRecord("Leads", leadMap, false, "zoho_crm_conn");
info resp;
```

5. Submit a test record and check that the matching lead appears in Zoho CRM.

In the lost and found application the Creator email action (DS-04 and DS-06) sends the notifications; creating a CRM lead for each claim would be a natural extension.

Result

The integration of a Zoho Creator form with Zoho CRM through a connection and a workflow script was studied, with the Claim_Requests form as the example. Creating a CRM lead for each claim is a possible future extension of the application.
