9. AI-Assisted Features & Zia Analytics in Zoho Creator

Aim

To study the artificial intelligence and analytics features of Zoho Creator (Zia) for querying data in natural language, generating charts and finding insights, and to record how they relate to the lost and found application.

Overview

Feature	Description	Relevance to the lost and found application
Zia natural-language query	Type a question about the application data and get a report or chart as the answer	Could answer questions such as claims by status
Smart analytics	Suggests metrics, charts and dashboards from the pattern of the data	Could suggest charts for the dashboard
Anomaly and prediction support	Flags unusual values and projects trends from past records	Could flag unusual claim counts
Dashboard analytics	Tiles, a bar chart and claim-status counts computed from stored records	Dashboard of Experiment 5(b); totals to be corrected (BUG-03)

Procedure

1. Study the Zia and analytics options of Zoho Creator.
2. Study the kind of natural-language questions Zia accepts, such as “show found items by category as a bar chart” or “show claims by status”.
3. Relate these features to the lost and found data and decide where they would help, for example claims by status or found items by category on the dashboard.

Result

The Zia and analytics features were studied and related to the lost and found data. The analytics feature of the application is the dashboard of Experiment 5(b), whose totals still disagree with the reports (BUG-03).
